Development

WORKING AS A TEAM

Designing the App

Deciding on the colors and the general design as a group.

Developing the App

Deciding on the tools to use and the key features to implement.

Meeting the Team

Discovering everyone's strengths and weaknesses.

Documentation

Planning the process, and tracking project developments.

The Showcase

Where all of it comes together.

SOLUTION OUTLINE

The Problem

A relationship manager has to manage hundreds of high-profile clients and doesn't have enough time.

Our Vision

Essentially, develop a simple, hassle-free, application to help Relationship Managers complete their tasks on a daily basis.

Usability

Efficiency

Security

REFINING THE TASK:

INTERNAL INFORMATION

First interview with Abdul:

- **Determination of the initial user requirements for CredX**

Second interview with Zahid

- **Prioritising various features of CredX according to his suggestions**

Independent Research

- **Researching the relevance of CredX features to Credit Suisse**

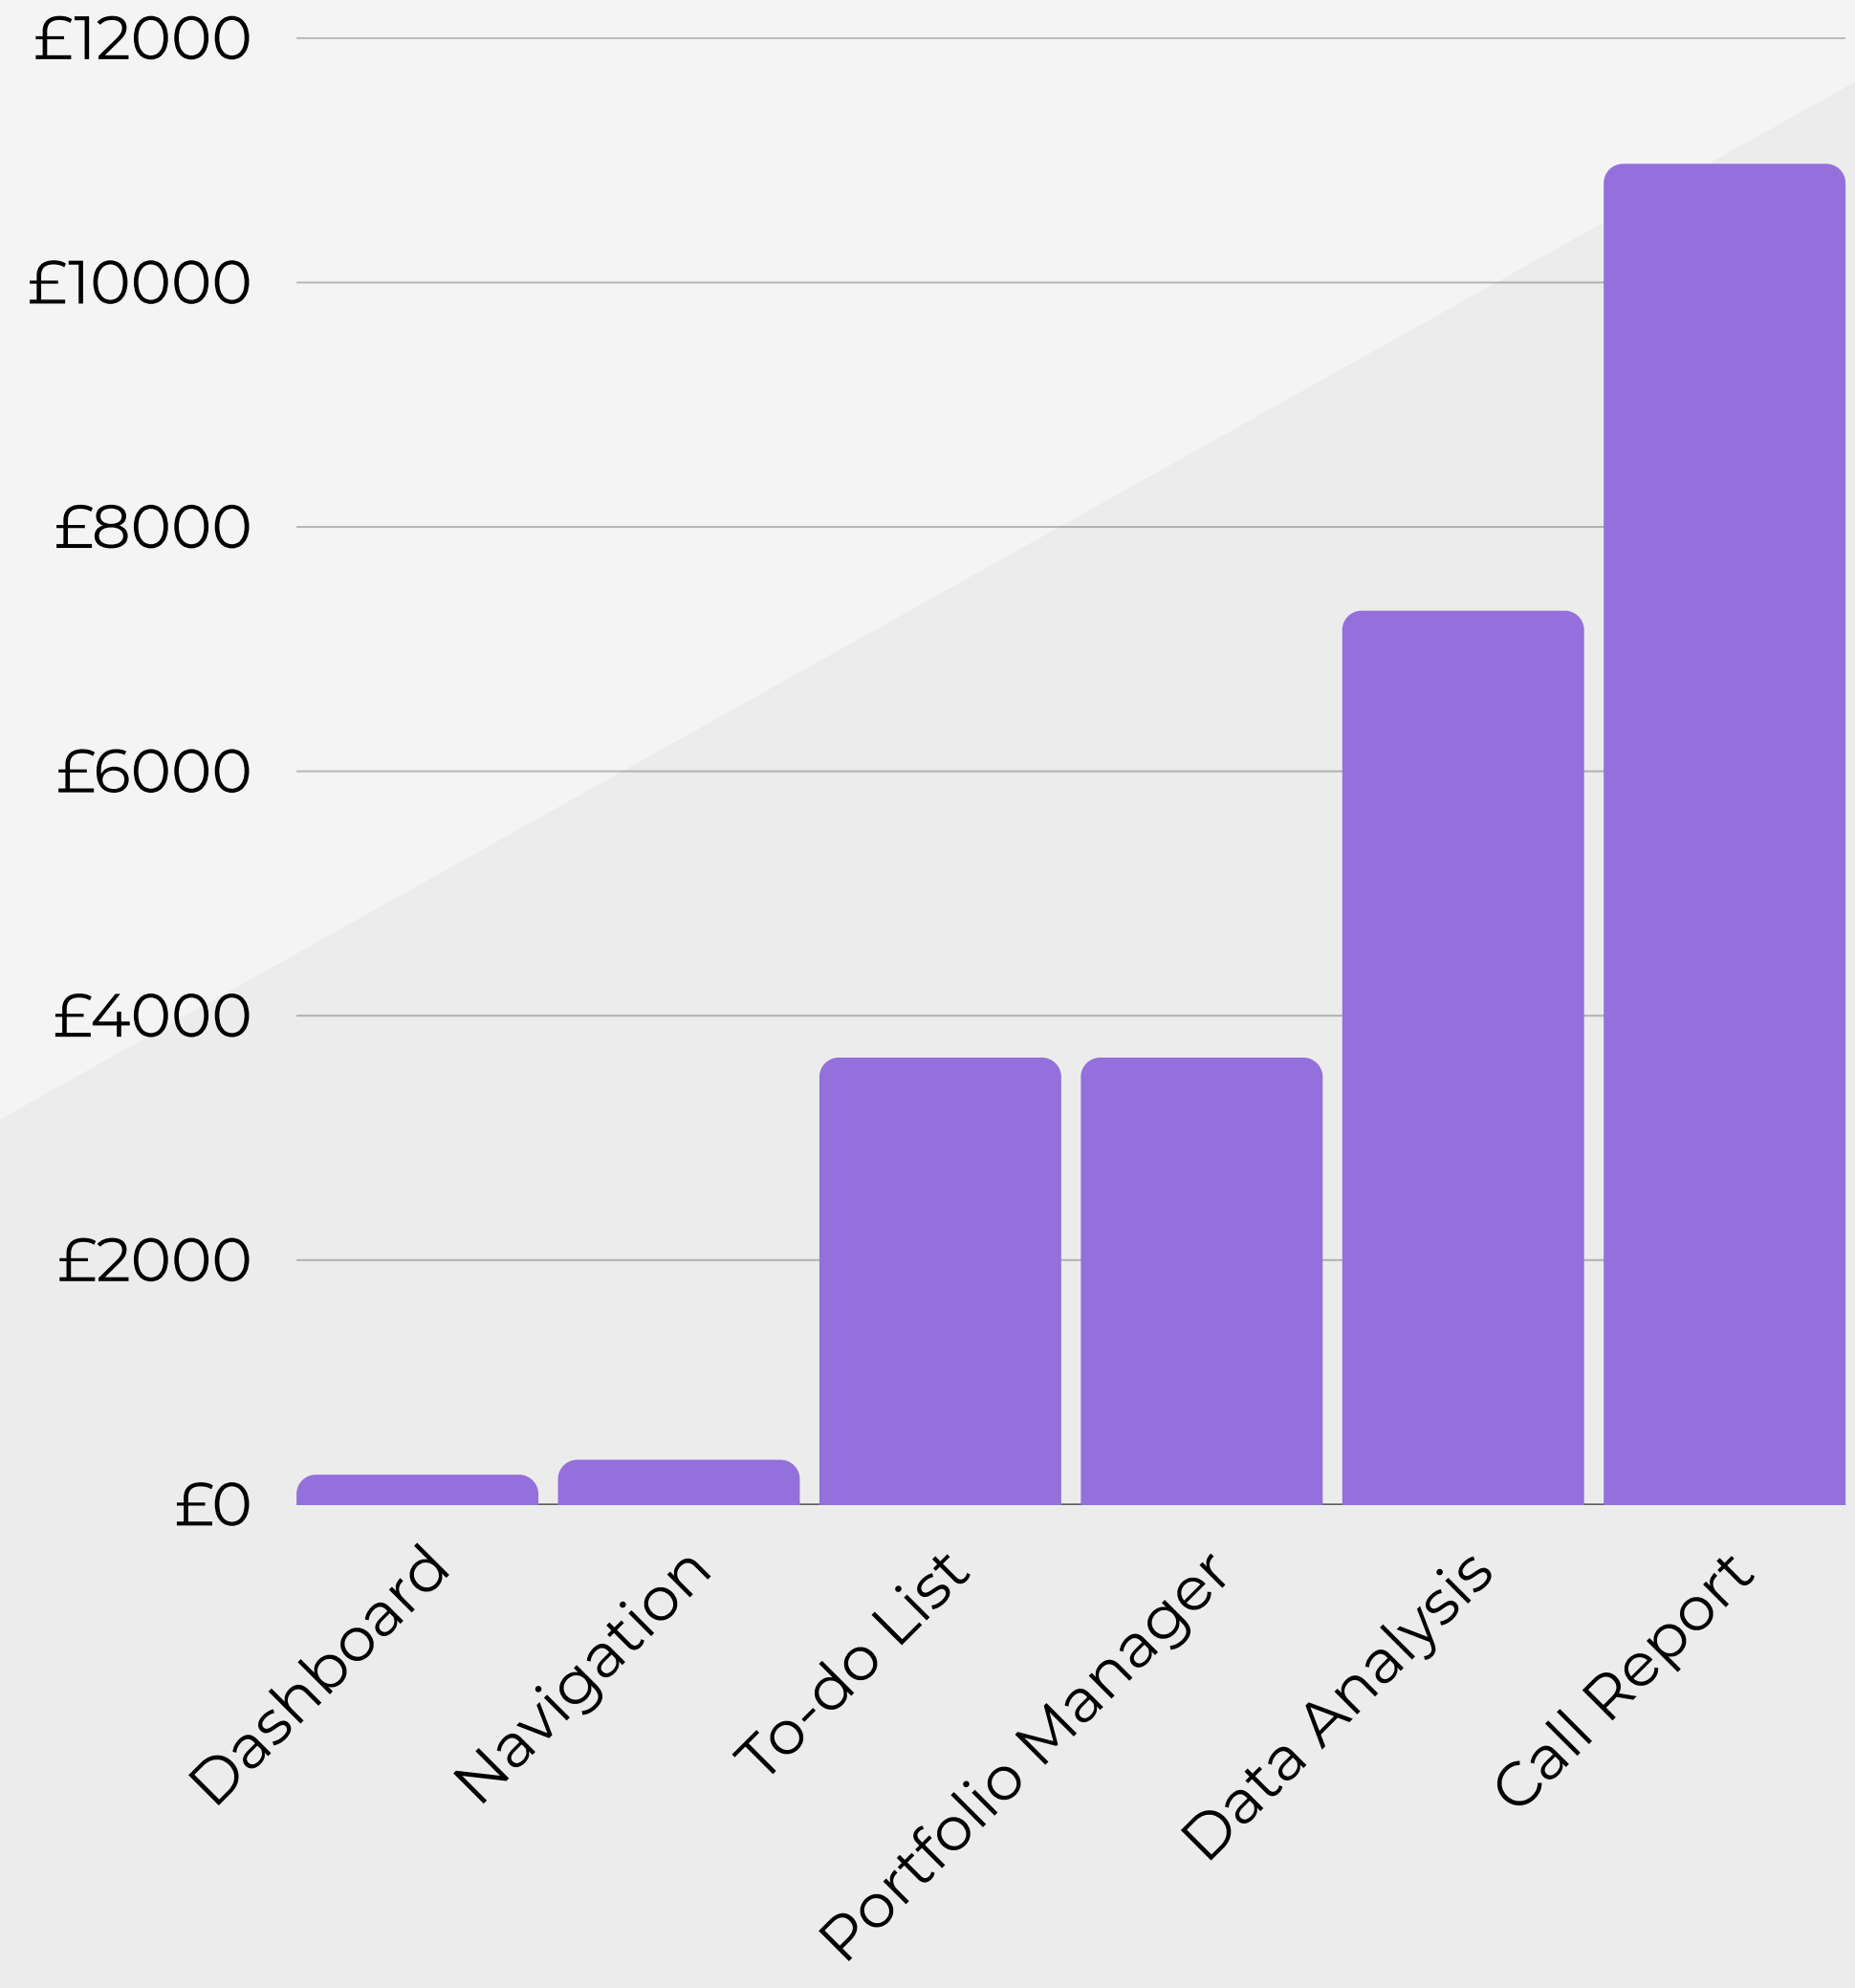

Interviewing Other Relationship Managers

- **Adding unique and relevant features to CredX**

FEATURE ANALYSIS

Analyzing the overall business value of our features based on the time they save the RM.

THE OVERALL EXPERIENCE

- Product Development
- Obstacles to Our Success
- Possible Improvements
- Learning Along the Journey

	Time Saved (Per Day)	Time Saved (Per Year)	Money Saved (Per Year)
Dashboard	40 Seconds	243 Minutes	£226.7
Navigation	1 Minute	365 Minutes	£340.5
Call Report	30 Minute	10 950 Minutes	£10 219.6
Portfolio Master	10 Minutes	3650 Minutes	£3 406.5
Data Analytics	20 Minutes	7300 Minutes	£6813.1
To Do List	10 Minutes	3650 Minutes	£3406.5

Total value for 3800 RMs = £24,413.079 * 3800 = £92,769,700

How did you find out how much an RM is earning per hour?

$160\text{k (Average RM salary)} / 48 \text{ (Work Weeks)} / 60 = 55.5 \text{ (56)}$

If the application does fail would it inherently lead to reputation damage for the company?

The risk of causing reputational damage is relatively low. This is because our application is to provide an add on for the relationship manager rather than it being a very dependent application. Therefore if things do fail, the relationship manager should still have all the relevant information on hand.

In terms of security, how are the information and passwords being protected?

To ensure a high level of security. We decided to use a database called MySQL that is encrypted. To access it through using the local network or using a specific VPN called Global Protect which we will provide to the RM in order to access the database.
